Agroverse · TrueSightDAO — China Market Entry Feasibility Brief

For decision-makers evaluating whether to introduce this project / enter the China market. Status: evaluation phase. Bottom line: Direction feasible, but "US compliance" ≠ "China market access"; a separate GACC registration is required; recommend small-step validation before committing. (2026-09-09)

1. What is the project (one sentence)

Agroverse / TrueSightDAO is a **Brazilian cacao traceable supply-chain project**: using GPS-tagged photo/video evidence packages to pin down "which plot it is grown on, where it is processed, who is behind it," satisfying the US FDA's **FSVP (Foreign Supplier Verification Program)** import review, with a DAO governance and traceability narrative layered on top.

Essence: **a "trusted supply chain" for premium cacao built on geo-tagged provenance + compliance evidence collection.**

2. Opportunity (why it is worth a look)

- **Category dividend**: China's demand for fine / single-origin chocolate & cacao is rising; products carrying a "verifiable origin + fair trade + regenerative agriculture" narrative command a premium.
- **Traceability as an asset**: Agroverse's GPS evidence system is reusable "trust infrastructure" — valuable not only for the US but also as a differentiator in China.
- **Friendly regulatory window**: After China Customs' 2025 system optimization, GACC registration for cacao products (excl. chocolate) no longer requires HS/CIQ codes or a conformance declaration; registration by category lowers the barrier significantly.
- **Regenerative agriculture bonus**: Its Block B "reforestation plot" evidence (carbon / biodiversity) aligns with domestic ESG and green-consumption narratives.

■■ The "opportunities" above are strategic hypotheses; market size and end-price require secondary due diligence.

3. Regulatory risk (the most fatal one)

Risk	Explanation
FSVP ≠ China access	FSVP is a US FDA framework. Entering China corresponds to China Customs GACC Foreign Enterprise Registr
Cacao needs official-recommended GACC registration	Per GACC Order No. 280 (effective 2026-06-01) + Announcement No. 219 (2025): raw cacao/cocoa beans and
Evidence package not directly usable	The GPS photo/video collected for FSVP is useful underlying provenance material, but GACC requires the comp
Additional product-side requirements	If importing bean-to-bar chocolate, Chinese labeling, CIQ, and possible additive/contaminant national-standard c

4. Key gaps (must fill before entry)

- China GACC registration path not started (competent-authority recommendation relationship not established)
- No China-regulation-oriented system docs / site plans / conformance declarations prepared
- Business model undecided: import beans? finished chocolate? or just introduce the "traceability system" for localization?
- China end-market and pricing not due-diligenced
- Brazilian side's willingness / export capacity to China unconfirmed

5. Recommendation (phased, small-step validation)

- **Define the model first** (A import goods / B introduce system / C both): determines compliance & investment structure.
- **GACC registration pre-assessment**: against Order No. 280, list materials the Brazilian side must supplement; estimate timeline (competent-authority recommendation typically takes several months).

- **Reuse traceability assets**: upgrade the FSVP GPS evidence system into a "dual US-China compliance" collection template — collect once, usable on both sides.
- **Small-batch pilot**: use one farm (e.g., La do Sítio) to run the first "Brazil → China" shipment, validating registration + logistics + labeling end-to-end, then scale.
